RY TISOLation and characterization of the human perinatal MHC promoter.";

RI Submitted (MAY-1998) to the EMBL/GenBank/DDBJ databases.

CC :- FUNCTION: MUSCLE CONTRACTION.

CC :- SUBUNIT: MUSCLE CONTRACTION.

CC :- SUBUNIT: MUSCLE MYOSIN IS A HEXAMERIC PROTEIN THAT CONSISTS OF 2

CC HEAVY CHAIN SUBUNITS (MHC), 2 ALKALI LIGHT CHAIN SUBUNITS (MLC)

CC AND 2 REGULATORY LIGHT CHAIN SUBUNITS OF THE MYOFIBRILS.

CC :- SUBCELLULAR LOCATION: THICK FILAMENTS OF THE MYOFIBRILS.

CC :- SUBCELLULAR LOCATION: THICK FILAMENTS OF THE MYOFIBRILS.

CC :- SUBCELLULAR LOCATION: THICK FILAMENTS OF THE MYOFIBRILS.

CC :- SUBCELLULAR LOCATION: THICK FILAMENTS OF THE MYOFIBRILS.

CC C CYCLES OF A 28-RESIDUE REPEAT PATTERN COMPOSED OF 4 HEPTAPEPTIDES,

CC C CYCLES OF A 28-RESIDUE REPEAT PATTERN COMPOSED OF 4 HEPTAPEPTIDES,

CC C CHARACTERISTIC FOR ALPHA-HELICAL COILED COILS.

CC C PYM: TWO CYSTEINE RESIDUES IN THE SI DOMAIN ARE SELECTIVELY

CC ALKYLATED AND ARE REQUIRED FOR MYOSIN ATPASE ACTIVITY.

CC ALKYLATED AND ARE REGUIRED FOR MYOSIN ATPASE ACTIVITY LIGHT

CC ALKYLATED AND ARE REGUIRED FOR MYOSIN ATPASE ACTIVITY.

HEAVY CHAIN SUBUNITS (MHC), 2 ALKALI LIGHT CHAIN SUBUNITS (MLC)
AND 2 REGULATORY LIGHT CHAIN SUBUNITS (MLC-2).

SUBCELLULAR LOCATION: THICK FILAMENTS OF THE MYOFIBRILS.
SUBCELLULAR LOCATION: THICK FILAMENTS OF THE MYOFIBRILS.
DOMAIN: THE ROLLIKE TAIL SEQUENCE IS HIGHLY REPETITIVE, SHOWING CYCLES OF A 28-RESIDUE REPEAT PATTERN COMPOSED OF 4 HEPTAPEPTIDES, CHARACTERISTIC FOR ALPHA-HELICAL COILED COILS.
CHARACTERISTIC FOR ALPHA-HELICAL COILED COILS.
PTM: TWO CYSTEINE RESIDUES IN THE S1 DOMAIN ARE SELECTIVELY ALKYLATED AND ARE REQUIRED FOR MYOSIN ATPASES ACTIVITY.
MISCELLANEOUS: EACH MYOSIN HEAVY CHAIN (CAN BE SPLIT INTO 1 LIGHT MEROMYOSIN (LMM) AND 1 HEAVY MEROMYOSIN (HMM). IT CAN LATER BE SPLIT FURTHER INTO 2 GLOBULAR SUBFRAGMENTS (S1) AND 1 ROD-SHAPED
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       MISCELLANEOUS: MHC A AND MHC B ARE FOUND EXCLUSIVELY IN THE WALL MUSCLE. THEY CO-ASSEMBLE INTO BODY WALL THICK FILAMENT SIMILARITY: CONTAINS 1 MYOSIN-LIKE GLOBULAR HEAD DOMAIN.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                MISCELLANEOUS: THERE ARE FOUR DIFFERENT MYOSIN HEAVY CHAINS
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   FUNCTION: MUSCLE CONTRACTION
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     SUBFRAGMENT (S2).

SUBUNIT: LAMININ IS A COMPLEX GLYCOPROTEIN, CONSISTIN DIFFERENT POLYPEPTIDE CHAINS (ALPHA, BETA, GAMMA), WITO EACH OTHER BY DISULFIDE BONDS INTO A CROSS-SHAPED COMPRISING ONE LONG & THREE SHORT ARMS WITH GLOBULES AT EACH END THE ALPHA-3 CHAIN IS A SUBUNIT OF LAMININ-5 (EPILIGRIN/KALININ/NICERN), AND POSSIBLY ALSO A COMPONENT OF LAMININ-6 (K-LAMININ) AND LAMININ-7 (KS-LAMININ). CONSISTING OF THREE GAMMA), WHICH ARE BOSS-SHAPED MOLECULE

: THE BASEMENT

-SUBCELLULAR LOCATION: EXTRACELLULAR; FOUND IN MEMBRANES (MAJOR COMPONENT).
ALTERNATIVE PRODUCTS: THE TWO ISOFORMS A AND E THE RODUCTS: THE TWO ISOFORMS A AND B DI DIFFER SMALLER VARIANT

TISSUE SPECIFICITY: SKIN; RESPIRATORY, URINARY, AND DIGESTIVE EPITHELIA AND IN OTHER SPECIALIZED TISSUES WITH PROMINENT SECRETORY OR PROTECTIVE FUNCTIONS. EPITHELIAL BASEMENT MEMBRANE, AND EPITHELIAL CELL TONGUE THAT MIGRAPES INTO A WOUND BED. A DIFFERENTIAL AND FOCAL EXPRESSION OF THE ALPHA-3 CHAIN IS OBSERVED. OBSERVED

INDUCTION: LAMININ-5 IS UP-REGULATED IN WOUND SITES OF HUMAN SKIN. DOMAIN: THE ALPHA-HELICAL DOMAINS I AND II ARE THOUGHT TO INTERACT WITH OTHER LAMININ CHAINS TO FORM A COILED COIL STRUCTURE.

DOMAIN: DOMAIN G IS GLOBULAR.

DOMAIN: DEFECTS IN LAMA3 ARE A CAUSE OF JUNCTIONAL EPIDERMOLYSIS BULLOSA (JEB) GRAVIS, ALSO KNOWN AS HERLITZ TYPE JEB. IT IS A BLISTERING DISORDER IN SKIN THAT IS CHARACTERIZED BY A SEPARATION OF BASAL CELLS FROM THE BASEMENT MEMBRANE DUE TO A DECREASED NUMBER OF HEMIDESMOSOMES. LAMININ-5 IS MISSING FROM THE BASEMENT MEMBRANE OF PATIENTS WITH THE GRAVIS FORM OF EPIDERMOLYSIS

SIMILARITY: SIMILARITY: CONTAINS 2.5 LAMININ EGF-LIKE DOMAINS.
5 LAMININ G-LIKE DOMAINS.

                                                                                                                                                                                                                                                                                                                                                                                                                                         The present invention provides compositions comprising ospC proteins and chimeric ospC proteins from members the Borrelia genus. These may be Borrelia burgdorferi, B. afzelii or B. garinii. These can be used as vaccines against Borrelia infection, which is spread by ticks and leads

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The present invention provides compositions comprising ospC proteins and chimeric ospC proteins from members of the Borrelia genus. These may be Borrelia burgdorferi, B. afzelii or B. garinii. These can be used as vaccines against Borrelia infection, which is spread by ticks and leads

                                                                                                                                                                                                                                                                                                                                                                                В
밁
            The present invention provides compositions comprising ospC proteins and chimeric ospC proteins from members of the Borrelia genus. These may be Borrelia burgdorferi, B. afzelii or B. garinii. These can be used as vaccines against Borrelia infection, which is spread by ticks and leads to Lyme disease.
                                                                        Chimeric -

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Вþ
                  vaccines
to Lyme d
                           The present invention provides compositions comprising ospC proteins and chimeric ospC proteins from members of the Borrelia genus. These may be Borrelia burgdorferi, B. afzelii or B. garinii. These can be used as vaccines against Borrelia infection, which is spread by ticks and leads

                                                                                                                                                                                                                                                                 AAB62731 standard; Protein;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The present invention provides compositions comprising ospC proteins and chimeric ospC proteins from members of the Borrelia genus. These may be Borrelia burgdorferi, B. afzelii or B. garinii. These can be used as vaccines against Borrelia infection, which is spread by ticks and leads
